

# EVOLUTIONARY TRANSITIONS BETWEEN BENEFICIAL AND PATHOGENIC RHODOCOCCUS

DR. JEFFREY CHANG

The Chang Lab uses molecular, genetic, genomic, cell biology, and computational methods to study the interactions between plants and their symbionts. They focus primarily on plant pathogenic bacteria and the molecular dialog that is exchanged with its warring partners. The lab is highly collaborative and research topics include microbial signaling, mRNA processing, and the study of other types of plant-pathogenic organisms.
